

Initial Prompts from Claude and ChatGPT

First Prompt - (Claude)

Hey let's say you are product manager with more than 10 years of experience with mix of both IC and team member, you have scaled many products to millions of users and turned it into the business numbers, like scaling the business to 10x in one year from an example, 10Lac to 1cr per month in one year.

your current company is: <https://store.everhope.care/>

You are leading the Product side.

Did you get your role?

Second Prompt- (ChatGPT)

Can we build a Dose tracking and reminder feature? which can help the user to engage with our platform and it is easy to retain those users. It will have all the details for the patient and dosage detail?

Third Prompt- (Claude)

what If we want to build Medication Dose reminder and tracker, like it will keep engaging our user and it will eventually help to retain the user.

Here I suggested some of the features,

Capability	Description
Medication/Supplement Schedule	Morning / afternoon / evening doses
Smart Reminders	Push/WhatsApp reminders
Dose Confirmation	"Taken / skipped" tracking
Missed Dose Recovery	Remind again if missed
Refill Prediction	Estimate when medicines will finish
Caregiver Visibility	Family can track adherence

Capability	Description
Treatment Timeline	Recovery phase tracking
Notes & Side Effects	Log symptoms after doses
Doctor Instructions	Food timing / restrictions
Multi-Medicine Support	Complex oncology regimens
Prescription Upload	Auto-create schedules from Rx
WhatsApp-Based Tracking	Simple reply-based adherence
Adherence Score	% consistency tracking
Escalation Logic	Multiple missed doses → caregiver alert

Forth Prompt- (Claude)

yes, write a prompt for the codex.

no need to cover all the features in this, we are having a ecom platform, so we will have all the details for the medication and it's dosage details, so we can use some data for building the demo version using AI.

Fifth prompt- (Claude)

Why to keep the Admin side of the website for now?
why can't we consider it as an Consumer application?

After this Claude generated the Codex prompt, which I pasted in the Codex,
Here is the output for that prompt-

Project: Everhope Care — Personal Supplement & Medication Companion for Cancer Patients

Context

Everhope (store.everhope.care) is a cancer nutrition and supplement brand. Patients undergoing cancer treatment purchase supplement bundles and nutrition programmes. This app is their personal daily companion — it remembers their supplement schedule, reminds them at the right time, tracks whether they took their doses, shows their progress, and tells them when to reorder. It is built for the

patient, owned by the patient, and designed to feel like a supportive friend — not a medical device or a brand tool.

The app uses pre-loaded product and patient data from the Everhope e-commerce platform. This is a demo prototype — no authentication, no WhatsApp API. Everything happens inside the web app.

Core design philosophy

Every decision in this app should pass this test: does this make the patient feel more in control of their health, or less? The tone is warm, personal, and encouraging. Never clinical. Never punitive. Never brand-forward. The Everhope logo appears once, quietly, in the corner. The patient's name and progress are what fill the screen.

Tech stack

- Frontend: React 18 with Vite, Tailwind CSS
- Backend: Node.js with Express
- Database: SQLite via better-sqlite3
- No authentication — patient is selected from a dropdown on first open, then stored in localStorage as the active session
- All data persists across page refreshes

Pre-loaded product data (seed this exactly)

javascript

```
const PRODUCTS = [
  {
    id: 1,
    name: 'Immune Support Bundle',
    short_desc: 'Curcumin · Vitamin D3 · Zinc',
    full_desc: 'Supports immune function and reduces inflammation during active treatment.',
    dosage: '2 capsules',
    times: ['08:00', '20:00'],
    instruction: 'Take with food. Avoid on empty stomach.',
    why_it_helps: 'Curcumin reduces treatment-related inflammation. Zinc supports white blood cell recovery.',
    capsules_per_pack: 60,
  },
  {
    id: 2,
```

```

    name: 'Gut Health Protocol',
    short_desc: 'Probiotic blend · Glutamine',
    full_desc: 'Restores gut lining and microbiome balance disrupted by chemotherapy.',
    dosage: '1 sachet',
    times: ['07:00'],
    instruction: 'Mix in lukewarm water. Take 30 minutes before breakfast.',
    why_it_helps: 'Chemo damages the gut lining. Glutamine helps repair it. Probiotics
restore healthy bacteria.',
    capsules_per_pack: 30,
  },
  {
    id: 3,
    name: 'Energy & Strength Pack',
    short_desc: 'Iron · B12 · CoQ10',
    full_desc: 'Combats treatment-related fatigue and supports red blood cell production.',
    dosage: '1 tablet',
    times: ['09:00'],
    instruction: 'Take with orange juice for better iron absorption. Avoid tea or coffee
within 1 hour.',
    why_it_helps: 'Chemo-related anaemia causes fatigue. Iron and B12 support red blood cell
recovery. CoQ10 supports cellular energy.',
    capsules_per_pack: 30,
  },
  {
    id: 4,
    name: 'Bone Health Formula',
    short_desc: 'Calcium · Vitamin K2 · Magnesium',
    full_desc: 'Protects bone density during hormone therapy and post-surgical recovery.',
    dosage: '2 tablets',
    times: ['08:00', '21:00'],
    instruction: 'Take with meals. Do not take within 2 hours of iron supplements.',
    why_it_helps: 'Hormone therapy accelerates bone density loss. This formula actively slows
that process.',
    capsules_per_pack: 60,
  },
  {
    id: 5,
    name: 'Anti-Nausea Support',
    short_desc: 'Ginger extract · B6 · Peppermint',
    full_desc: 'Manages chemotherapy-induced nausea naturally and safely.',
    dosage: '1 capsule',
    times: ['08:00', '13:00', '19:00'],
    instruction: 'Take 30 minutes before meals. Can be taken on empty stomach.',
    why_it_helps: 'Ginger extract has strong clinical evidence for chemo-induced nausea. B6
reduces nausea signals in the brain.',
    capsules_per_pack: 90,
  }
];

```

Pre-loaded patient data (seed this exactly)

javascript

```
const PATIENTS = [

    assigned_products: [3, 4, 5],
    start_date: '2026-03-15',
    avatar_initials: 'KN',
    avatar_color: '#993556',
    streak_goal: 5,
  }
];
```

Seed historical dose log

On first run, seed 45 days of historical dose records per patient. Rules:

- Generate one dose slot per product time entry per day per patient
- Adherence distribution per patient:

- Priya: 82% overall. Misses cluster in evenings (20:00 slots more likely to be missed)
 - Arun: 91% overall. Very consistent. Random occasional misses
 - Kavitha: 68% overall. Afternoon slots (13:00) most likely to be missed. Some full-day gaps
 - Status: `taken`, `missed`, or `pending` (today and future only)
 - `taken_at` timestamp: within 0–25 minutes of scheduled time for taken doses
 - `symptom_note`: populated on ~20% of taken records. Use a mix of: "slight nausea after dose", "no issues today", "felt bloated for an hour", "energy felt better this morning", "mild stomach cramp", "slept well last night", "no side effects", "a bit tired today", "felt stronger than yesterday"
 - Today's doses: all start as `pending`
-

Application routes

- `/` — Welcome / patient selection screen
- `/home` — Patient home screen (main daily view)
- `/schedule` — Full schedule and today's doses
- `/progress` — Adherence history, streaks, and trends
- `/supplements` — Supplement details and refill status
- `/log/:doseId` — Inline dose logging action (can also be a modal — choose what's cleaner)

All routes share a persistent bottom navigation bar with icons and labels for: Home, Schedule, Progress, Supplements.

Screen: Welcome `/`

This is the only screen where Everhope branding is prominent. Three patient cards — name, cancer type, treatment phase, avatar circle. A subtitle: "Your personal supplement companion." Selecting a patient stores their ID in `localStorage` and routes to `/home`.

Make this feel like choosing your profile on a streaming service — warm, personal, visually distinct per patient (use their `avatar_color`).

Screen: Home `/home`

This is the screen the patient sees every time they open the app. It should answer one question immediately: "What do I need to do right now?"

Layout top to bottom:

Greeting header

Personalised by time of day and patient name:

- Before 12pm: "Good morning, Priya."
- 12–5pm: "Good afternoon, Priya."
- After 5pm: "Good evening, Priya."

Below the greeting, one contextual line based on today's status:

- If all done: "You've taken all your doses today. Well done."
- If some pending: "You have 2 doses coming up today."
- If overdue pending exists: "You have a dose overdue — let's catch up."

Streak card

Current consecutive days with $\geq 80\%$ adherence displayed as a large number with a flame-style indicator. Label: "day streak". Below: "Personal best: X days." If streak is 0: "Start your streak today — take today's doses." This is the primary gamification hook — make it visually prominent.

Next dose card

A single prominent card showing the next upcoming dose (soonest pending dose by scheduled time). Shows: product name, scheduled time, dosage, instruction. Two large buttons: "Mark as taken" and "Skip for today." If all doses are done for the day, this area shows a celebration state: "All done for today 🌿 See you tomorrow." If it's past 9pm and all doses are done, show the next morning's first dose instead ("Tomorrow morning: Gut Health Protocol at 7:00 AM").

Today's remaining doses

Below the next dose card, a compact list of remaining doses for the day — not full

cards, just a row per dose: product name + time + status chip. Tapping any row opens the full dose action.

Quick stats strip

Three small metric tiles in a row:

- Today: "X of Y taken"
- This week: "XX%"
- Streak: "X days"

Screen: Schedule /schedule

Full view of today's complete dose schedule, then tomorrow's preview.

Each dose card shows:

- Product name and short description
- Scheduled time
- Dosage + instruction
- why_it_helps text in a collapsible "Why this supplement?" section — patient can tap to expand. This is important: patients who understand why they're taking something are more adherent.
- Status: pending / taken (with taken-at time) / missed / overdue
- Actions: "Mark as taken" / "Skip" (only for pending/overdue)
- After marking taken: a small optional "How do you feel?" prompt — patient can type a short note or tap one of four quick chips: "No issues", "Slight nausea", "Felt good", "Some discomfort"

Doses sorted by scheduled time. Overdue pending doses shown at the top with a subtle amber border.

Screen: Progress /progress

The patient's personal health journal view. Warm, not clinical.

30-day adherence score

Large number, prominently displayed. One-line interpretation below (same logic as before: encouraging at every level, never shaming).

Streak history

Current streak + personal best streak. A small row of the last 14 days as coloured dots — green ($\geq 80\%$), amber (50–79%), red ($< 50\%$), grey (no data / future).

Weekly breakdown

Last 6 weeks shown as a bar or dot chart. Each week's adherence % labelled. Built with Recharts. Show a trend line if possible.

Symptom log feed

All symptom notes the patient has logged, in reverse chronological order. Each entry shows: date, time, product name, note. Title: "Your notes." If empty: "No notes yet — you can add notes after taking a dose." This becomes the patient's personal health journal over time.

Insight card (AI-generated)

A single card at the bottom of the progress screen. Call the Anthropic Claude API on the frontend to generate a personalised weekly insight based on the patient's adherence data and symptom notes. Pass this data to the API:

javascript

```
const prompt = `
You are a warm, supportive nutritionist at Everhope, a cancer nutrition brand.
A patient named ${patient.name} is on ${patient.treatment_phase} for ${patient.cancer_type}.
Their supplement adherence this week was ${weeklyAdherence}%.
Their adherence last week was ${lastWeekAdherence}%.
Their current streak is ${streak} days.
Recent symptom notes they logged: ${recentNotes.join(', ') || 'none'}.
Their assigned supplements are: ${assignedProducts.join(', ')}.

Write a short, warm, personal insight (3–4 sentences maximum) for ${patient.name} about their
progress this week.
Acknowledge what they did well. If adherence dropped, be gentle and encouraging – never
blame.
If they logged symptoms, acknowledge that and offer one practical tip relevant to their
supplement or phase.
End with one specific encouragement for the coming week.
Do not use bullet points. Write as if speaking directly to the patient.
Do not mention Everhope by name.
`;
```

Show the insight in a card with a soft teal background. Label it: "Your weekly insight from our nutritionist." Show a loading state while the API call runs. If the API fails, show a fallback: "Keep going — consistency is what makes the difference. Every dose counts."

Use the Anthropic API exactly as follows — no API key needed, it is handled by the environment:

javascript

```
const response = await fetch('https://api.anthropic.com/v1/messages', {
  method: 'POST',
  headers: { 'Content-Type': 'application/json' },
  body: JSON.stringify({
    model: 'claude-sonnet-4-20250514',
    max_tokens: 1000,
    messages: [{ role: 'user', content: prompt }]
  })
});
const data = await response.json();
const insight = data.content[0].text;
```

Screen: Supplements /supplements

The patient's personal supplement shelf. One card per assigned product.

Each card shows:

- Product name and short description
- `why_it_helps` text (always visible here — not collapsed)
- Dosage and schedule times
- Instruction line (e.g. "Take with food")
- Refill status: doses remaining, days until depletion, a visual progress bar showing pack fullness
- If depleting within 7 days: amber "Running low" badge
- If depleting within 3 days or already at 0: red "Reorder now" badge
- A "Reorder" button linking to <https://store.everhope.care>

Refill calculation (implement exactly):

```
doses_taken = count of 'taken' records for this product for this patient
doses_remaining = capsules_per_pack - doses_taken
daily_dose_count = length of product.times array
days_remaining = floor(doses_remaining / daily_dose_count)
```

At the top of the screen, if any product is depleting within 7 days, show a dismissible banner: "You're running low on [product name]. Reorder to avoid a gap in your protocol."

Dose logging actions

When patient taps "Mark as taken" anywhere in the app:

1. Immediately update the UI optimistically — don't wait for API response
2. POST to `/api/doses/:doseId/taken` with `{ takenAt: new Date().toISOString() }`
3. Show a small inline confirmation: "Logged at 8:04 AM ✓"
4. Show the optional symptom prompt (chips + text input). Patient can dismiss it
5. If symptom is entered, POST to `/api/doses/:doseId/symptom`
6. Recalculate and update: streak count, today's summary strip, adherence score

When patient taps "Skip":

1. POST to `/api/doses/:doseId/missed`
2. Update UI immediately
3. No guilt messaging. Just update the status chip to "Skipped"
4. If this is the 3rd consecutive missed dose for any product: show a gentle nudge card on the home screen — "You've missed a few [Product Name] doses. If something's making it hard to take, our nutritionist can help." With a WhatsApp link (use `https://wa.me/919999999999` as placeholder).

Bottom navigation bar

Persistent across all routes except `/`. Four tabs:

- Home (ti-home icon)
- Schedule (ti-calendar icon)
- Progress (ti-chart-bar icon)
- Supplements (ti-pill icon)

Active tab uses `#1A7F5A` accent colour. Inactive tabs are grey. Clean, minimal — no labels needed if icons are clear, but include small labels below each for accessibility.

API endpoints

- `GET /api/patients` — all patients
- `GET /api/patients/:id` — one patient with products and schedule
- `GET /api/doses/:patientId/today` — today's dose slots with status
- `GET /api/doses/:patientId/history?days=45` — full dose history
- `POST /api/doses/:doseId/taken` — mark taken, body: `{ takenAt }`
- `POST /api/doses/:doseId/missed` — mark missed
- `POST /api/doses/:doseId/symptom` — add note, body: `{ note }`
- `GET /api/adherence/:patientId` — returns: today summary, weekly breakdown (last 7 days % per day), 30-day score, current streak, personal best streak, last 6 weeks % for chart, refill predictions per product
- `GET /api/insights/:patientId` — optional: server-side Claude API call returning the weekly insight text (alternatively call Claude directly from frontend as described above)

Design requirements

- Accent: `#1A7F5A` (Everhope teal-green). Primary actions, taken status, streak indicator, active nav tab.
- Amber: `#D97706` for warnings, overdue doses, low refill
- Red: `#DC2626` for missed doses, critical refill, 3-consecutive-miss nudge
- Backgrounds: white (`#FFFFFF`) and off-white (`#F9FAFB`). No dark backgrounds on any screen.
- Cards: white background, subtle border (`1px solid #E5E7EB`), `border-radius: 12px` , gentle padding
- Typography: system font stack. Body 16px, line-height 1.6. Headings bold but not heavy.
- The app must feel like a consumer health app — think a calm, clean version of a personal health companion. Reference: the warmth of Headspace, the clarity of a well-designed medication tracker.

- Mobile-first. All screens must work cleanly at 375px. Desktop just centres the content at max-width 480px.
- No placeholder lorem ipsum anywhere.
- All numbers: whole integers or one decimal place maximum.
- Transitions: subtle fade on dose status changes. Nothing jarring.

Folder structure

```

/client      React frontend (Vite)
/server      Express backend
/server/db.js SQLite schema, all seed data
README.md    npm install && npm run dev

```

Final checklist

- ☐ Patient selection on `/` stores choice and routes to `/home`
- ☐ Home screen greeting changes by time of day
- ☐ Streak count is correct and updates when a dose is marked taken
- ☐ Next dose card shows the correct upcoming dose
- ☐ "Mark as taken" updates UI immediately without reload
- ☐ Symptom chips and text input appear after marking taken
- ☐ Skip updates status with no guilt messaging
- ☐ 3 consecutive misses triggers the gentle nudge card
- ☐ Progress screen shows correct 30-day adherence per patient (~82%, ~91%, ~68%)
- ☐ Weekly chart renders with Recharts
- ☐ AI insight card calls Claude API and renders returned text
- ☐ Insight card shows fallback text gracefully if API fails
- ☐ Supplements screen shows correct days-remaining per product
- ☐ Reorder banner appears when any product is within 7 days of depletion
- ☐ Bottom nav persists across all screens and highlights active tab

- ☐ All screens work at 375px mobile width
- ☐ No console errors on any screen
